**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

<b>Office Action Summary</b>	<b>Application No.</b>	<b>Applicant(s)</b>	
	10/673,733	HAYARDENY ET AL.	
	<b>Examiner</b>	<b>Art Unit</b>	
	Paul Kim	2161	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

#### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### Status

- 1) Responsive to communication(s) filed on 03 January 2007.
- 2a) This action is FINAL.                    2b) This action is non-final.
- 3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

- 4) Claim(s) 1-60 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) Claim(s) \_\_\_\_\_ is/are allowed.
- 6) Claim(s) 1-60 is/are rejected.
- 7) Claim(s) \_\_\_\_\_ is/are objected to.
- 8) Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

- 9) The specification is objected to by the Examiner.
- 10) The drawing(s) filed on \_\_\_\_\_ is/are: a) accepted or b) objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

- 12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) All    b) Some \* c) None of:
1. Certified copies of the priority documents have been received.
  2. Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

Art Unit: 2161

### **DETAILED ACTION**

1. This Office action is responsive to the following communication: Amendment filed on 3 January 2007.
2. Claims 1-60 are pending and present for examination. Claims 1, 21, 30, and 41 are independent.

#### ***Continued Examination Under 37 CFR 1.114***

3. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 25 June 2007 has been entered.

#### ***Double Patenting***

4. As per the nonstatutory double patenting rejection, Applicant's terminal disclaimer is acknowledged. Accordingly, the rejection has been withdrawn.

#### ***Terminal Disclaimer***

5. The terminal disclaimers filed on 3 January 2007 and 18 January 2007 disclaiming the terminal portion of any patent granted on this application have been reviewed and is accepted. The terminal disclaimers have been recorded.

#### ***Claim Rejections - 35 USC § 103***

6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art

Art Unit: 2161

are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

7. **Claims 1-12, 18-20, 21-32, 38-40, 41-52, and 58-60** are rejected under 35 U.S.C. 103(a)

as being unpatentable over Yanai et al (U.S. Patent No. 5,742,792, hereinafter referred to as Yanai), filed on 28 May 1996, and issued on 21 April 1998, in view of Tummala et al (U.S. Patent No. 7,035,881, hereinafter referred to as Tummala), filed on 23 September 2003, and issued on 25 April 2006.

8. **As per independent claims 1, 10, 21, 30, 41, and 50,** Yanai, in combination with Tummala,

discloses:

A method for managing a data storage system that includes primary and secondary storage subsystems, including respective first and second non-volatile storage media, the method comprising:

maintaining a bitmap record on the secondary storage subsystem, which is predictive of locations to which data are to be written on the primary storage subsystem by a host processor {See Yanai, C11:L15-30, wherein this reads over "the present system maintains a list or index, utilizing one or more flag bits, in a hierarchical structure, on each physical and logical data storage device" and "each data storage system maintains an indication of write or copy pending 102 of both the primary data (M1) 104, and the secondary data (M2)", and C12:L6-7, wherein this reads over "each data storage device keeps data validity information about its mirrored device"}, the record including a designation of locations to which the host is expected to write in the near future;

receiving at the primary storage subsystem, from the host processor, the data to be written to a specified location on the first non-volatile storage media {See Yanai, C11:L31-34, wherein this reads over "when a host computer writes data to a primary data storage system, it sets both the primary and secondary bits 104, 106 of the write pending bits 102 when data is written to cache"};

making a determination that the specified location is not included in the record, and responsively to the determination sending a message from the primary storage subsystem to the secondary storage subsystem so as to cause the secondary storage subsystem to update the record {See Yanai, C12:L6-21, wherein this reads over "every new write command goes to the accessible mirrored device along with information that the not accessible device has a track which is not valid" and "when a specific track is not shown on both the primary and secondary storage system, an indication of such will be assigned"},

wherein sending the message causes the secondary storage subsystem to predict one or more further locations to which the host processor has not yet written the data and is expected to write the data in a subsequent write operation, and to set a number of predicted bits in the record corresponding to the one or more further locations {See TUMMALA, C7:L52-61, wherein this reads over "identifying when read/write access to the production file system is about to modify the contents of an invalid data block is to use a meta bit map having a bit for indicating whether or not each allocated block of storage in the production file system is valid or not", and C8:L42-62, wherein this reads over "an

Art Unit: 2161

*entry for the block (Bi) is inserted into the block map at the tail of the snapshot queue, and then the bit for the block (Bi) is set in the bit map at the tail of the snapshot queue".*

wherein the number of the predicted bits is chosen so as to achieve a desired balance between low average latency and rapid failure recovery<sup>1</sup>;

signaling the host processor that the data have been stored in the data storage system responsively to receiving the data and, when the specified location was not included in the record, responsively to receiving an acknowledgment at the primary storage subsystem from the secondary storage subsystem indicating that the record has been updated {See Yanai, C15:L36-43, wherein this reads over "[t]he data storage system containing the primary (R1) volume informs the host that an I/O sequence has successfully completed only after the data storage system containing the secondary (R2) volume acknowledges that it has received and checked the data"; and

storing the data in the specified location on both the first and second non-volatile storage media {See Yanai, C11:L37-43, wherein this reads over "[w]hen the primary data storage system controller's disk adapter writes the data to the primary data storage device" and "[o]nce the secondary data storage system has written the data"}.

While Yanai may fail to expressly disclose the use of bits and bitmap records in managing a data storage system, it is noted that Tummala discloses an invention wherein bits and bitmaps are used in allocating space within a data storage. The allocated data storage space is then held so that a subsequent write operation may write data in said allocated data storage space. Thus, it would have been obvious to one of ordinary skill in the art to modify the invention as disclosed by Yanai with the invention as disclosed by Tummala.

One of ordinary skill in the art would have been motivated to make this modification so that free locations within a storage subsystem may be held for a subsequent write operation to said location.

**9. As per dependent claims 2, 22, and 42,** Yanai, in combination with Tummala, discloses:

The method according to claim 1, wherein sending the message comprises copying the data synchronously from the primary storage subsystem to the secondary storage subsystem {See Yanai, C15:L36-39, wherein this reads over "data on the primary (R1) and secondary (R2) volumes are always fully synchronized at the completion of an I/O sequence"}.

**10. As per dependent claims 3, 23, and 43,** Yanai, in combination with Tummala, discloses:

The method according to claim 2, wherein storing the data comprises, upon making the determination that the specified location is included in the record, copying the data

---

<sup>1</sup> The Examiner notes that the method step of choosing the number of predicted bits "so as to achieve a desired balance between low average latency and rapid failure recovery" is an intended use. Accordingly, the claim limitation, as recited, is not afforded any patentable weight.

Art Unit: 2161

from the primary storage subsystem to the secondary storage subsystem asynchronously, without updating the record with respect to the specified location {See Yanai, C2:L58-65, wherein this reads over "asynchronously with the primary host computer requesting the writing of data to the primary data storage system"}.

11. **As per dependent claims 4, 24, and 44,** Yanai, in combination with Tummala, discloses:

The method according to claim 3, wherein copying the data comprises transmitting the data between mutually-remote sites over a communication link between the sites {See Yanai, C5:L16-20, wherein this reads over "the remote mirroring facility is provided with a migration mode which is active during host processing of a primary (R1) volume and iteratively copies updates from the primary (R1) volume to a secondary (R2) volume"}.

12. **As per dependent claims 5, 25, and 45,** Yanai, in combination with Tummala, discloses:

The method according to claim 3, wherein maintaining the record comprises maintaining a copy of the record on the primary storage subsystem, and wherein signaling the host processor comprises, upon making the determination that the specified location is included in the record, indicating to the host processor that the data have been stored without waiting to receive the acknowledgment from the secondary storage subsystem {See Yanai, C3:L43-48, wherein this reads over "[t]he data storage system containing the primary (r1) volume informs the host that an I/O sequence has successfully completed without waiting for the data storage system containing the secondary (R2) volume to acknowledge that it has received and checked the data"}.

13. **As per dependent claims 6, 26, and 46,** Yanai, in combination with Tummala, discloses:

The method according to claim 1, wherein copying the data comprises creating a mirror on the secondary storage subsystem of the data received by the primary storage subsystem {See Yanai, C58-65, wherein this reads over "the remote data copying or mirroring is completely independent of and transparent to the host computer system"}.

14. **As per dependent claims 7, 27, and 47,** Yanai, in combination with Tummala, discloses:

The method according to claim 6, and comprising, upon occurrence of a failure in the primary storage subsystem, configuring the secondary storage subsystem to serve as the primary storage subsystem so as to receive further data from the host processor to be stored by the data storage system {See Yanai, C17:L39-44, wherein this reads over "Under the abnormal condition of the data being entirely absent from the data storage system due to a disk drive failure, however, a request for data access to a primary (R1) volume can be satisfied by obtaining the requested data from the secondary volume (R2) in the remote data storage system"}.

15. **As per dependent claims 8, 28, and 48,** Yanai, in combination with Tummala, discloses:

The method according to claim 6, and comprising, upon recovery of the system from a failure of the primary storage subsystem, conveying, responsively to the record, a portion of the data from the secondary storage subsystem to the primary storage subsystem for storage on the primary storage subsystem {See Yanai, C27-L56-59, wherein this reads over "[w]hen the defective disk device is replaced, the data storage system re-synchronizes the mirrored pair, automatically copying data to the new disk"}.

Art Unit: 2161

16. **As per dependent claims 9, 29, and 49,** Yanai, in combination with Tummala, discloses:

The method according to claim 1, wherein maintaining and updating the record comprise marking respective bits in a bitmap corresponding to the locations to which the data are to be written on the first and second non-volatile storage media {See Yanai, C35:L22-61}.

17. **As per dependent claims 11, 31, and 51,** Yanai, in combination with Tummala, discloses:

The method according to claim 10, wherein sending the message comprises modifying both the record and the copy of the record responsive to the specified location {See Yanai, C11:L31-43, wherein this reads over "When the primary data storage system controller's disk adapter writes the data to the primary data storage device, it will reset bit 104 of the write pending indicator bits 102. Similarly, once the secondary data storage system has written the data to the secondary data storage device, the secondary data storage write pending indicator bit 106 will be reset"}.

18. **As per dependent claims 12, 32, and 52,** Yanai, in combination with Tummala, discloses:

The method according to claim 11, wherein modifying both the record and the copy of the record comprises adding a plurality of locations, including the specified location, to both the record and the copy of the record {See Yanai, C11:L31-35, wherein this reads over "when a host computer writes data to a primary data storage system, it sets both the primary and secondary bits 104, 106 of the write pending bits 102 when data is written to cache"}.

19. **As per dependent claims 18, 38, and 58,** Yanai, in combination with Tummala, discloses:

The method according to claim 1, wherein sending the message causes the secondary storage subsystem to designate one or more further locations to which the host processor is expected to write the data in a subsequent write operation, and to add the one or more further locations to the record {See Yanai, C25:L16-61}.

20. **As per dependent claims 19, 39, and 59,** Yanai, in combination with Tummala, discloses:

The method according to claim 18, wherein the one or more further locations comprise a predetermined number of consecutive locations in proximity to the specified location {See Yanai, C40:L3-5, wherein this reads over "The preferred format for the information in the link buffer 505 is a string of track and record identifications and indications of where the records are found in the cache 228"}.

21. **As per dependent claims 20, 40, and 60,** Yanai, in combination with Tummala, discloses:

The method according to claim 18, wherein maintaining the record comprises recording the locations to which the data are written using an object-based storage technique, and wherein the one or more further locations are chosen based on a logical connection between storage objects {See Yanai, C3:L25-29, wherein this reads over "The operating mode for each logical volume can be specified to best suit the purposes of the desired remote mirroring, the particular application using the volume, and the particular use of the data stored on the volume"}.

Art Unit: 2161

22. **Claims 13-14, 33-34 and 53-54** are rejected under 35 U.S.C. 103(a) as being unpatentable over Yanai, in view Tummala, and in further view of Dunham (U.S. Patent No. 6,269,431), filed on 13 August 1998, and issued on 31 July 2001.

23. **As per dependent claims 13, 33 and 53,** Yanai, as modified by Tummala and Dunham, discloses:

The method according to claim 10, wherein maintaining the copy of the record comprises selecting one or more locations, other than the specified location, to be removed from the record, and instructing the secondary storage subsystem to remove the one or more locations from the record, so as to limit a size of the record {See DUNHAM, C17:L67-C18:L4, wherein this reads over "[u]pon completion of a file deletion command, the secondary data storage subsystem would return an acknowledgment to the host, and the host could update its catalog to reflect deletion of the files from the back-up version of the file system"}.

While Yanai may fail to expressly disclose the instructing of the second storage subsystem to remove locations from a record, the combination of inventions disclosed in Yanai and Dunham would disclose an invention which removed one or more locations from the record. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the above invention suggested by Yanai by combining it with the invention disclosed by Dunham.

One of ordinary skill in the art would have been motivated to do this modification so that the size of the record may be limited by archiving and purging unnecessary entries from the record. In addition, Yanai and Dunham are analogous art because they belong to the same field of endeavor, such as, back up and mirroring data between a plurality of storage devices, memory allocation, and database management systems.

24. **As per dependent claims 14, 34 and 54,** Yanai, as modified by Tummala and Dunham, discloses:

The method according to claim 13, wherein storing the data comprises copying the data to be stored in the one or more locations from the primary storage subsystem to the secondary storage subsystem {See Yanai, C1:L30-38, wherein this reads over "the copying of the primary data to a secondary data storage system controller which forms part of a secondary data storage system"}, and

wherein selecting the one or more locations comprises receiving a return message from the secondary storage subsystem indicating that the secondary storage subsystem has received the copied data {See Yanai, C15:L36-43, wherein this reads over

Art Unit: 2161

*"[t]he data storage system containing the primary (R1) volume informs the host that an I/O sequence has successfully completed only after the data storage system containing the secondary (R2) volume acknowledges that it has received and checked the data"; and*

selecting the one or more locations to be removed from the record responsively to the return message {See DUNHAM, C17:L38-C18-24, wherein this reads over "[t]he procedure, for example, deletes files of the file system that have expired or that a user or application program did not request to be backed up" and "the back-end data mover updates the secondary directory to refer to the new, compacted file system and thereby delete the original backup version of the file system"}.

While Yanai may fail to expressly disclose the selection of locations to be removed from the record responsively to the return message, the combination of inventions disclosed in Yanai and Dunham would disclose an invention which selected one or more locations from the record for removal. Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the above invention suggested by Yanai by combining it with the invention disclosed by Dunham.

One of ordinary skill in the art would have been motivated to do this modification so that the size of the record may be limited by archiving and purging selected entries from the record. In addition, Yanai and Dunham are analogous art because they belong to the same field of endeavor, such as, back up and mirroring data between a plurality of storage devices, memory allocation, and database management systems.

25. **Claims 15-17, 35-37 and 55-57** are rejected under 35 U.S.C. 103(a) as being unpatentable over Yanai, in view of Tummala, in view of Dunham, and in further view of Official Notice.

26. **As per dependent claims 15, 35 and 55**, it would have been obvious to one of ordinary skill in the art at the time the invention was made to identify locations containing identical data since multiple copies of identical data need not be stored in multiple locations. Furthermore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to remove the location which was least-recently added so that the least-current location containing the identical data may be discarded.

27. **As per dependent claims 16, 36 and 56**, it would have been obvious to one of ordinary skill in the art at the time the invention was made to group the entries added to the copy of the record and

Art Unit: 2161

the record in generations so that the generations, or versions, of entries may be used in discarding entries of a certain generation or version using a batch method.

28. **As per dependent claim 17, 37 and 57,** it would have been obvious to one of ordinary skill in the art at the time the invention was made to append an instruction to the message sent from the primary storage subsystem to the secondary storage subsystem, so that the appended instruction may be used in providing the secondary storage subsystem with the instructions to remove the locations.

***Response to Arguments***

29. Applicant's arguments with respect to claims 1-60 have been considered but are moot in view of the new ground(s) of rejection.

***Conclusion***

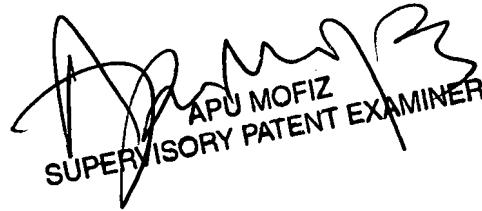

30. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Paul Kim whose telephone number is (571) 272-2737. The examiner can normally be reached on M-F, 9am - 5pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Apu Mofiz can be reached on (571) 272-4080. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
